AL MIRATH

East Africa Renewable Energy Investment Opportunities 2023

Energy-transition demand, investment pathways and real-estate implications

Corporate Expansion & Real Estate Opportunity Intelligence

Prepared from the Al Mirath analytical dataset | Reporting cut-off: 2023

2023 regional GDP	Avg. GDP growth	Avg. FDI inflows
$605.6B	**5.3%**	**3.9%**
available East Africa scope	available 2023 markets	of GDP, available values

Data note: the supplied project data contains limited directly verified renewable-energy project records through 2023. This report therefore separates source-supported renewable evidence from broader market and real-estate opportunity themes. Later-dated solar, geothermal and hydropower examples in the dataset are not treated as 2023 evidence.

Executive Summary

Direct renewable evidence	Enabling property signals	High-priority adjacency	Scenario property tickets
1	**13**	**9**	**$65.5M**
source-supported through 2023	industrial + logistics, <=2023	score >= 70	not verified investment value

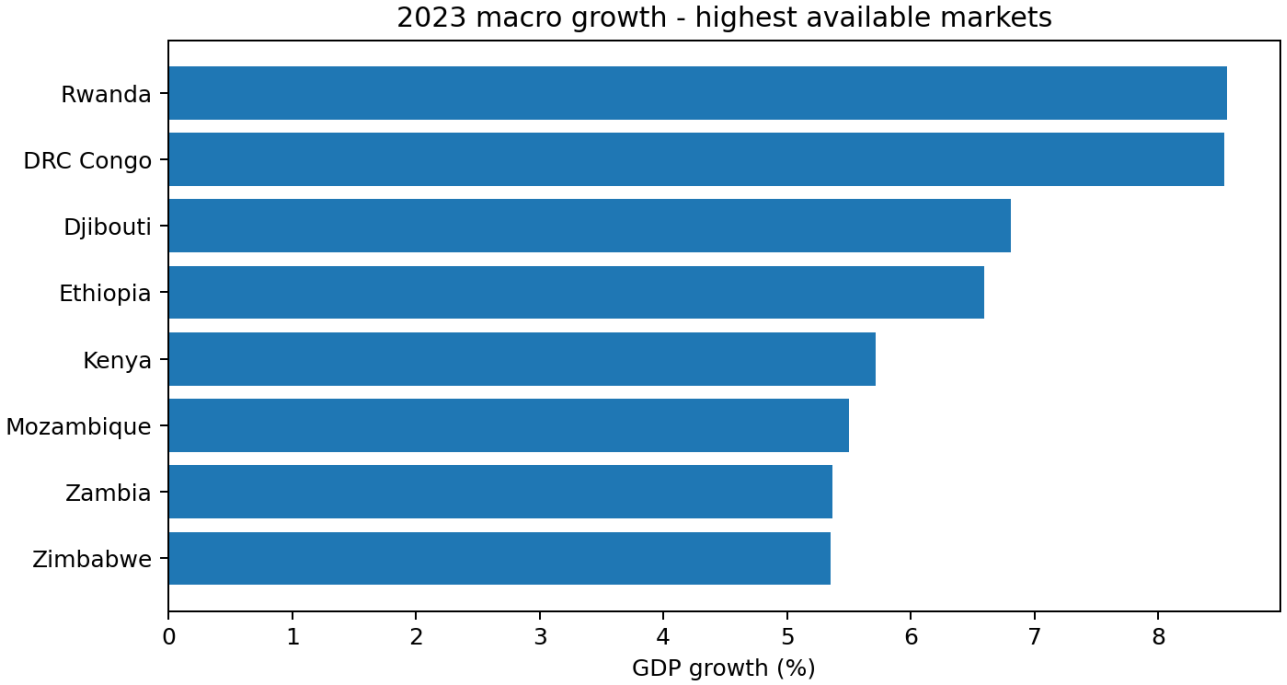

- The supplied dataset supports a cautious renewable-energy investment thesis rather than a broad verified project pipeline as of 2023.
- The clearest directly supported renewable-energy-linked record through 2023 is Malawi's 60MW Golomoti Solar project, where the dataset captures the logistics execution required to move 221 TEUs via the Port of Beira in 2021.
- The wider opportunity case comes from macro growth, FDI intensity, industrial/logistics demand and infrastructure connectivity - all of which shape the locations where clean-energy supply chains, powered industrial sites and energy-linked occupiers can scale.
- The 2023-cut real-estate register contains 13 industrial/logistics signals, 9 above the 70-point high-priority threshold. These are enabling-location signals, not renewable projects.
- Later renewable-linked examples in the source files - including solar manufacturing, geothermal-powered data infrastructure and subsequent power projects - are explicitly excluded from the 2023 evidence base.

Investment lens

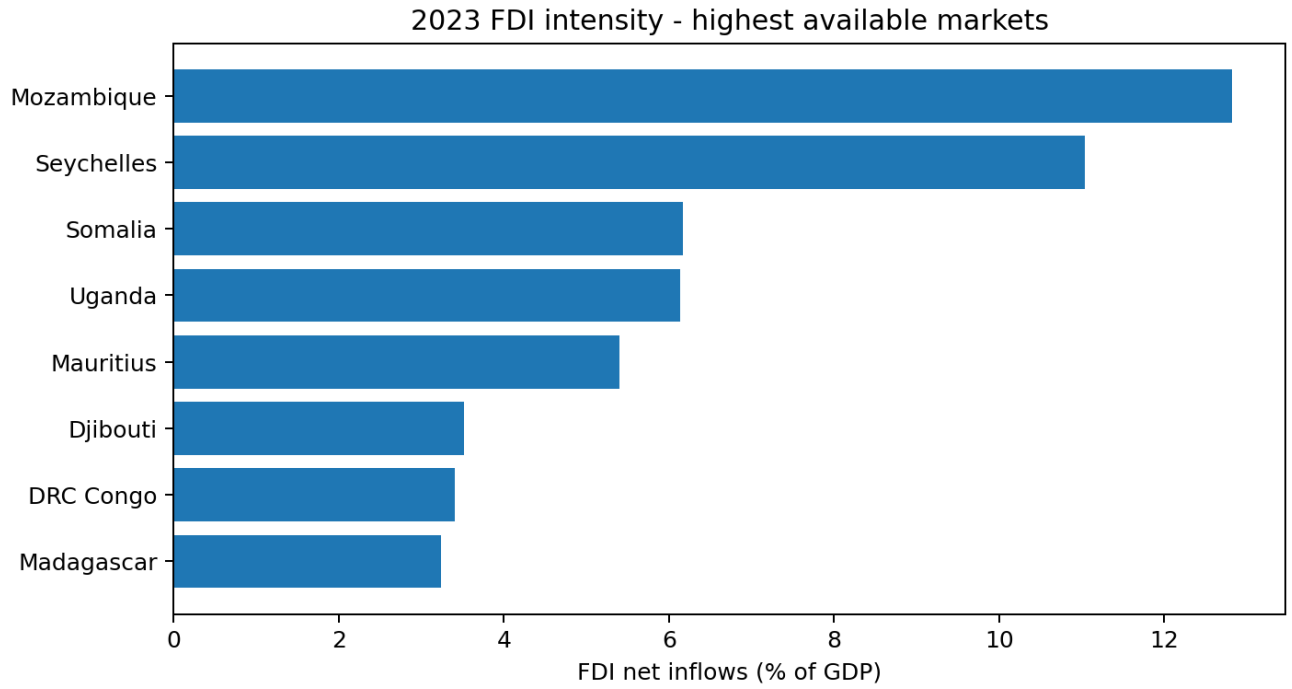

For 2023, the most defensible strategy is to screen markets for renewable-energy enabling conditions: strong economic growth, FDI capacity, industrial/logistics demand, corridor access, and occupiers whose operations can benefit from reliable lower-carbon power.

1. 2023 Market Context for Renewable Investment

Renewable-energy investment decisions are highly sensitive to macroeconomic scale, growth, capital inflows, infrastructure quality and the cost of importing equipment. The Al Mirath dataset provides these market-level indicators even where direct project-level renewable coverage is incomplete.

Growth markets can support energy demand expansion, but GDP growth alone does not establish project bankability. Grid conditions, offtake structure, land, permitting and financing remain project-specific diligence items.

High FDI intensity can indicate stronger international capital engagement, but FDI in the macro dataset is economy-wide and should not be interpreted as renewable-energy FDI specifically.

2. Source-Supported Renewable Energy Evidence Through 2023

Market	Company / operator	Renewable-linked evidence	Year	Source
Malawi	Bolloré Logistics Malawi	Won and completed the logistics contract for Malawi's 60MW Golomoti Solar project, shipping 221 TEUs via the Port of Beira between March and December 2021.	None	Bolloré Logistics Malawi successfully completes logistics for the Golomoti Solar project

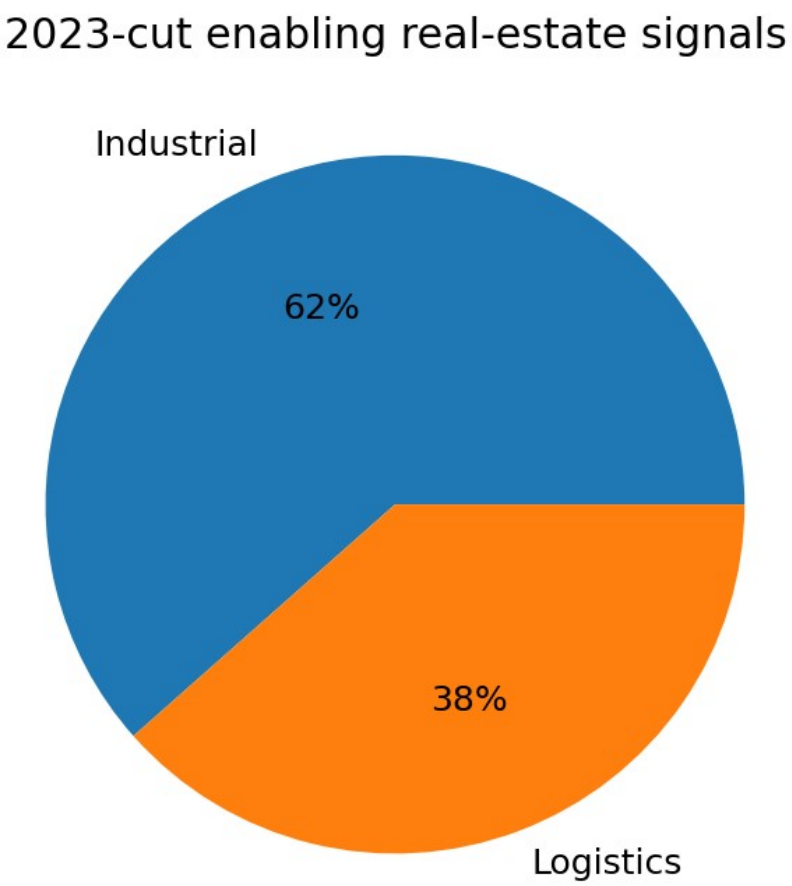

What this evidence tells us

- Renewable projects create real-estate and logistics demand beyond the generation asset itself: imported equipment, temporary staging, warehousing, construction logistics, operations support and industrial supply-chain space.
- The Golomoti example is useful because it links utility-scale solar development to a concrete logistics requirement, showing how energy investment can generate demand along port-to-project corridors.
- The current dataset is not sufficiently complete to rank East African countries by verified renewable project value, installed capacity or pipeline size as of 2023. Those metrics should not be invented.

3. Enabling Real Estate Opportunity Set

Because the direct renewable project register is sparse, the strongest dataset-supported secondary lens is the industrial and logistics opportunity set. These asset classes are the most relevant for solar-component assembly, electrical equipment, project logistics, warehousing, cold chain, powered industrial estates and energy-intensive digital infrastructure.

Industrial signals	Logistics signals	Combined	High priority
8	5	13	9
2023-cut in-scope	2023-cut in-scope	enabling opportunities	score >= 70

Interpretation: these records are property-demand screening signals. They do not confirm renewable-energy tenancy, available sites or executed investment.

Market	Lead company	Asset	Facility	Score
Tanzania	DP World	Logistics	Distribution Center	94
Rwanda	ARISE Integrated	Industrial	Construction Project	88

	Industrial Platforms (ARISE IIP)			
DRC Congo	Africa Global Logistics (MSC Group)	Logistics	Distribution Center	84
Kenya	Huawei Technologies	Industrial	Data Centre	83
Djibouti	China Merchants Port Holdings Company Limited	Logistics	Distribution Center	78
Uganda	Uganda Airlines (Uganda National Airlines Company)	Logistics	Distribution Center	74
Ethiopia	Raxio Group	Industrial	Data Centre	72
Rwanda	Africa Data Centres (Cassava Technologies)	Industrial	Data Centre	72

4. Opportunity Themes for Renewable-Energy Investors

Solar and equipment supply chains

Industrial parks and logistics nodes can support modules, cells, inverters, storage equipment, electrical components and project-import handling. The dataset supports this as an enabling real-estate theme, not as a verified 2023 manufacturing pipeline.

Clean-powered industrial locations

Markets with strong industrial demand and access to lower-carbon electricity may be attractive to occupiers facing energy-cost or decarbonisation requirements. Site-level power reliability and tariff economics require independent verification.

Project logistics and warehousing

The Golomoti Solar logistics record demonstrates the importance of ports, inland freight, storage and customs execution for renewable projects. Similar requirements can support logistics real estate near strategic corridors.

Digital infrastructure and power demand

Data centres and telecom infrastructure are power-intensive occupiers. Later-dated records in the dataset reference geothermal- and solar-linked digital infrastructure, but these are excluded from the 2023 evidence base and should be treated as future-reference examples only.

Industrial estates and SEZs

SEZs and industrial parks can provide serviced land, customs advantages and infrastructure concentration. Renewable-energy integration can strengthen their occupier proposition, but the supplied dataset does not verify 2023 renewable generation at each zone.

5. Country Screening Priorities

The following priorities are analytical screening recommendations derived from the supplied macro, opportunity and infrastructure datasets. They are not rankings of verified renewable project pipelines.

Market	Signals	High priority	Avg score	Renewable relevance
Rwanda	2	2	80.0	Industrial/logistics enabling demand
Djibouti	2	1	68.5	Industrial/logistics enabling demand
Tanzania	1	1	94.0	Industrial/logistics enabling demand
DRC Congo	1	1	84.0	Industrial/logistics enabling demand
Kenya	1	1	83.0	Industrial/logistics enabling demand
Uganda	1	1	74.0	Industrial/logistics enabling demand
Ethiopia	1	1	72.0	Industrial/logistics enabling demand
Burundi	1	1	71.0	Industrial/logistics enabling demand

Priority interpretation

- Kenya, Tanzania, Uganda and Ethiopia merit continued screening because of their economic scale, logistics relevance and industrial demand in the wider dataset.
- Rwanda and selected smaller markets can be attractive where strong growth, targeted infrastructure and investment facilitation offset smaller absolute market size.
- Mozambique and other high-FDI-intensity markets deserve targeted review, but macro FDI ratios alone do not establish renewable bankability.

6. Investment Risks and Due-Diligence Requirements

Risk / diligence item	Implication
Project evidence coverage	Direct renewable project coverage in the supplied 2023-cut data is incomplete. Build a dedicated project register before making pipeline-value or installed-capacity claims.
Grid and offtake	Verify grid connection, curtailment, utility credit, PPA terms, wheeling rules and private-power frameworks market by market.
Land and permitting	The real-estate workbook intentionally leaves available land unverified unless supported by evidence. Do not substitute indicative land requirement for land availability.
Currency and inflation	Several markets show elevated inflation or currency pressure, affecting imported equipment, debt service, construction cost and tariff viability.
Logistics execution	Renewable equipment is import- and transport-intensive. Port capacity, customs, inland corridors, oversized-load handling and storage can materially affect schedules and cost.
Data vintage	Later-dated renewable examples exist in the source files, but they are excluded from this 2023 report to preserve the reporting cut-off.

7. 2023 Strategic Takeaways

- Treat renewable energy as an investment-enabling theme within the broader East African industrial, logistics and infrastructure opportunity landscape, rather than overstating the current project-level evidence.
- Prioritise markets where growth, FDI, trade corridors and industrial/logistics demand overlap with a credible power-sector reform and bankable offtake environment.
- Develop a dedicated renewable-project data layer covering technology, capacity, project stage, sponsor, capex, offtaker, PPA status, grid connection, land, location coordinates and source date.
- For real-estate strategy, focus on the secondary demand generated by renewable investment: equipment assembly, warehousing, staging, contractor space, powered industrial sites and logistics corridors.
- Use post-2023 solar, geothermal and hydropower examples only in later editions of the report or a forward-looking pipeline supplement.

Bottom line

The 2023 dataset supports a credible renewable-energy opportunity thesis at the market and enabling-real-estate level, but not a comprehensive verified renewable project pipeline. The next analytical step is to build that project register rather than inflate the evidence already available.

8. Methodology & Data Notes

Item	Treatment
Reporting cut-off	31 December 2023 for core evidence. Later expansion events are excluded from 2023 project claims.
Macro data	Macro_Source_2019_2023 provides GDP, growth, GDP per capita, inflation and FDI. FDI is economy-wide, not renewable-specific.
Renewable evidence	Company_profile was screened for solar, wind, hydro, geothermal and renewable references. Records whose described investment event occurs after 2023 were excluded from the core evidence set.
Real-estate adjacency	RE_Opportunities is filtered to In Dashboard Scope = 1, Signal Year <= 2023, Asset Class = Industrial or Logistics. These are enabling property signals, not renewable projects.
High priority	Opportunity Score >= 70, consistent with the workbook methodology.
Scenario values	Estimated Value and land requirement fields in the real-estate model are scenario fields and are not verified renewable investment amounts or available land.
Data limitation	The source dataset is broader corporate expansion and real-estate intelligence, not a dedicated renewable-energy project database. This limitation is material to interpretation.
